

Minimize Resource Consumption Maximize Efficiency

What is Target Zero

Target Zero optimizes your facilities' resource use practices with the ultimate objective of zero waste.

This methodology evaluates your minimum energy, water, and/or chemical usage requirements, compares them to current usage volumes, and modifies system applications to minimize those usages. This translates into significant dollar savings.

How it Works

Sali Group coordinates with vendors, equipment suppliers, and plant personnel to assess resource use and establish a minimum use baseline.

Usage evaluation includes review of:

- Energy
- Water
- Chemicals
- Production Equipment
- Facility Physical Plant

The usage baseline is established as the "Target Zero" for the organization. If a large discrepancy exists between actual use and "Target Zero" use, **Sali Group** develops a customized **Target Zero** program that, when implemented, will reduce resource consumption to near this baseline number.

Why Do You Need Target Zero?

Simply put, it will optimize your productivity. By reducing resources required to produce each part, your cost drops. In a climate that demands suppliers to provide a percentage reduction in cost every year, Target Zero is a programmatic approach to not only achieve but exceed these reduction targets. The result? Higher profits.

In most industrial environments, system applications were not designed as an integrated unit to function efficiently with each other. In general, they have been enhanced, upgraded, and pieced together over several years, and sometimes decades. They are rarely designed at the onset with a focus of zero excess waste.

Tiered Service Options

Sali Group offers three levels of the Target Zero program to fit your budget and resources.

Level 1: **Sali Group** will provide consulting services to guide your team through the process of establishing the optimum resource use baseline, and provide direction to develop an action plan to reach that target.

Level 2: **Sali Group** will calculate the optimum resource use baseline and develop an action plan to reach that target. With Level 2, a fully integrated data management program is provided to track program performance.

Level 3: This is a turnkey approach. **Sali Group** will establish the optimum resource use baseline, develop an action plan to reach that target and provide staff on a contract basis to implement the program.
