

How Safe and Efficient are your Water Systems?

Every Facility maintains a large water system as part of their daily operations. The safety and efficiency of these water distribution systems is important, but often unmanaged. How confident are you that your potable water system is safe from cross connections and in compliance with Federal drinking water standards? A thorough review of your system's details will provide the answer.

Sali Group, LLC, constructs our Water Safety and Reliability program to include a thorough review of these system details, applicable plumbing codes and Federal Drinking Water Standards. Furthermore our experienced team of engineers and contractors are qualified to implement any review changes that are recommended.

One benefit of a thorough water system review is the impact on water utility cost. In addition to identifying water quality issues, we can identify water use concerns and make recommendations that may reduce your water utility bill.

Sali Group can help you identify noncompliance, problem areas and potential cost saving opportunities in your potable, process and utility water systems and sewage systems. We can help you document your systems, track changes, and track required or preventative maintenance and testing.

Program

Sali Group offers engineering services and field investigations. We understand that one size does not fit all. We tailor our program around each facility to ensure that we provide the most cost effective and appropriate services and staff.

We offer complete engineering department services including maintaining facility records that are web accessible and developing and maintaining facility standards.

Approach

We begin by meeting with your team to determine your facility's requirements. From that meeting, we develop a customized proposal to address your needs. When appropriate, our proposal may discuss the discrete steps to fully identify and then implement the best solutions to meet your requirements. At each step of the process, we provide feedback to help define the possible next step. We partner with your team throughout the process to develop the best solutions for your company.

Services

- Water Safety Evaluation (Cross connection, backflow, etc)
- Water Use Documentation
- Flow and thermal studies
- Water and wastewater minimization and reuse
